Conditions Report

There is currently a bloom of the harmful algae, Dinophysis, around Corpus Christi and Aransas bays. This algal bloom does not produce respiratory irritation impacts associated with the Texas red tide caused by Karenia brevis. No respiratory irritation impacts are expected alongshore Texas today through Sunday, March 27.

Analysis

Blooms of Dinophysis are rare in the US, and we do not have a standard for monitoring with remote sensing. Imagery does not provide a useful reference for the blooms, but may aid in circulation patterns. Recent imagery is partially obscured by patches of clouds along the coast, north of the Galveston Bay region. Elevated chlorophyll (2-7 µg/L) is visible along- and offshore stretching from the Galveston Bay area to South Padre Island. Elevated chlorophyll seems to be due to the resuspension of benthic chlorophyll and sediments and is most likely not related to a harmful algal bloom.

Transport forecasts presume that the cells have moved in the Gulf of Mexico. We cannot forecast transport in the bays at this time. Forecast models indicate a negligible transport (< 10 km) along the coast from Port Aransas from March 19 to 23.

Satellite chlorophyll image and forecast winds for March 22, 2011 06Z with cell concentration sampling data from March 12 to 17 shown as red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). For a list of cell count data providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide: http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Verified and suspected HAB areas shown in red. Other areas of high chlorophyll concentration shown in yellow (see p. 1 analysis for interpretation).
