Conditions Report

There is currently no indication of a harmful algal bloom at the coast in Texas, and the Texas Department of State Health Services (DSHS) has re-opened the approved portions of Corpus Christi Bay, Aransas Bay, and St. Charles Bay to shellfishing. No impacts are expected alongshore Texas today through Sunday, April 24.

Analysis

There is currently no indication of a harmful algal bloom along the coast of Texas. Recent sample data indicate that the *Dinophysis ovum* bloom has diminished significantly, and the Texas Department of State Health Services (DSHS) has re-opened the approved portions of Corpus Christi Bay, Aransas Bay, and St. Charles Bay to shellfishing (TWPD; 4/15).

Much of the coast is obscured by clouds in recent imagery limiting analysis. Elevated to significant levels of chlorophyll (4 to >20 µg/L) are visible along- and offshore stretching from Sabine Pass to the Matagorda Bay area. Elevated chlorophyll seems to be due to the resuspension of benthic chlorophyll and sediments and is most likely not related to a harmful algal bloom.

Forecast models indicate negligible (<10 km) transport north along the coast from Port Aransas from April 16 to 21.

Kavanaugh, Urizar

Wind conditions from Port Aransas-Coast, TX
