NOAA National Weather Service
Last bulletin: Monday, June 24, 2013

Conditions Report

Karenia brevis (commonly known as Florida red tide) ranges from not present to background concentrations along the coast of southwest Florida, including the Florida Keys. No respiratory irritation is expected Monday, July 1 through Monday, July 8. Check http://tidesandcurrents.noaa.gov/hab/beach_conditions.html for recent, local observations.

Analysis

Samples collected over the last week identified background concentrations of Karenia brevis in Pinellas County at Clearwater Pass (FWRI; 6/26) and in central Sarasota County at Nokomis Beach and North Jetty (FWRI; 6/24). Background concentrations also continue to be identified at Palma Sola Bay in southern Manatee County (FWRI; 6/25). All other samples collected along- and offshore southwest Florida, from Pinellas to Monroe County, including the Florida Keys, indicate that no K. brevis is present (FWRI, MML, SCHD; 6/11-27). No dead fish or respiratory irritation associated with K. brevis have been reported in the past week (FWRI, MML; 6/24-30).

MODIS Aqua imagery has been obscured by clouds alongshore southwest Florida over the last several days, limiting analysis. In MODIS Aqua imagery from June 28 (shown left), patches of elevated to high chlorophyll (2 to >10 \( \mu g/L \)) are visible along- and offshore Pinellas to Lee counties; elevated to very high chlorophyll (2 to >20 \( \mu g/L \)) is visible along- and offshore southern Collier to northern Monroe County. Elevated chlorophyll at the coast is likely the result of mixed non-harmful algal blooms that continue to be reported in many southwest Florida counties.

Harmful algal bloom formation alongshore southwest Florida is not expected today through Monday, July 8.

Derner, Burrows

Satellite chlorophyll image with possible K. brevis HAB areas shown by red polygon(s), when applicable. Points represent cell concentration sampling data from June 21 to 27: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Florida Fish and Wildlife Conservation Commission (FWC) Fish and Wildlife Research Institute. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:
http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Detailed sample information can be obtained through FWC Fish and Wildlife Research Institute at:

Wind Analysis

**Southwest Florida:** South winds (15-20kn, 8-10m/s) today through Tuesday becoming southeast (10-15kn, 5-8m/s) Tuesday night through Thursday. East winds (10-15kn) Thursday night. Southeast winds (10-15kn) Friday.

Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts. Wind observation and forecast data provided by NOAA’s National Weather Service (NWS).
Satellite chlorophyll image and forecast winds for July 2, 2013 06Z with points representing cell concentration sampling data from June 21 to 27: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Florida Fish and Wildlife Conservation Commission (FWC) Fish and Wildlife Research Institute. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide: http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Verified and suspected HAB areas shown in red. Other areas of high chlorophyll concentration shown in yellow (see p. 1 analysis for interpretation).
