Gulf of Mexico Harmful Algal Bloom Bulletin
Region: Southwest Florida
Monday, 09 June 2014

NOAA National Ocean Service
NOAA Satellite and Information Service
NOAA National Weather Service
Last bulletin: Monday, June 2, 2014

Conditions Report
*Karenia brevis* (commonly known as Florida red tide) ranges from not present to background concentrations along the coast of southwest Florida, and is not present in the Florida Keys. No respiratory irritation is expected Monday, June 9 through Monday, June 16. Check [http://tidesandcurrents.noaa.gov/hab/beach_conditions.html](http://tidesandcurrents.noaa.gov/hab/beach_conditions.html) for recent, local observations.

Analysis
Samples collected over the past ten days along the coast of southwest Florida from Pinellas to Collier counties all indicate that *Karenia brevis* is not present, with the exception of three background concentrations identified in samples collected in Pinellas County at Clearwater Pass, Sarasota County at Bay Dock, and Collier County at Seagate (FWRI, MML, SCHD; 5/30-6/5).

Recent MODIS Aqua imagery alongshore southwest Florida has been obscured by clouds over the past several days, limiting analysis. In MODIS Aqua imagery from 6/7 (shown left), patches of elevated chlorophyll (2-6 µg/L) are visible along- and offshore portions of Pinellas to Lee counties. Elevated chlorophyll along the coast may be the result of various non-toxic blooms that have been reported throughout the region.

Harmful algal bloom formation at the coast of southwest Florida is not expected today through Monday, June 16.

Burrows, Urizar

---

Satellite chlorophyll image with possible *K. brevis* HAB areas shown by red polygon(s), when applicable. Points represent cell concentration sampling data from May 30 to June 5: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Florida Fish and Wildlife Conservation Commission (FWC) Fish and Wildlife Research Institute. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide: [http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf](http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf)

Detailed sample information can be obtained through FWC Fish and Wildlife Research Institute at: [http://myfwc.com/redtidestatus](http://myfwc.com/redtidestatus)

Wind conditions from Venice Pier, FL

Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts. Wind observation and forecast data provided by NOAA’s National Weather Service (NWS).

Wind Analysis
*Southwest Florida:* Northwest winds today (5kn, 3 m/s) becoming west (10kn, 5 m/s) in the afternoon and tonight becoming southwest (10-15, 5-8 m/s) after midnight. South winds (5kn) Tuesday becoming southwest (5kn) in the afternoon and lasting through Thursday night (10kn). West winds Friday (10kn).
Satellite chlorophyll image and forecast winds for June 10, 2014 06Z with points representing cell concentration sampling data from May 30 to June 5: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Florida Fish and Wildlife Conservation Commission (FWC) Fish and Wildlife Research Institute. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:
http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Verified and suspected HAB areas shown in red. Other areas of high chlorophyll concentration shown in yellow (see p. 1 analysis for interpretation).
