Conditions Report

*Kareinia brevis* (commonly known as Florida red tide) ranges from not present to background concentrations along the coast of northwest Florida from Escambia to Taylor counties. No respiratory irritation is expected alongshore northwest Florida Monday, October 27 through Thursday, October 30.

Analysis

*Kareinia brevis* (commonly known as Florida red tide) ranges from not present to background concentrations along the coast of northwest Florida from Escambia to Taylor counties. Sampling over the past week at the Pensacola Beach Pier, in Escambia County, detected one background *K. brevis* concentration (FWRI; 10/22). All other sampling alongshore and in the bay regions of Escambia, Santa Rosa, Okaloosa, Walton, Bay, Wakulla, and Taylor counties indicated *K. brevis* is not present (FWRI; 10/17-10/22). Surface samples collected during an offshore transect 3-7 miles south of Wakulla and Jefferson counties on 10/18 also indicated *K. brevis* was not present (FWRI). No fish kills or respiratory irritation associated with *K. brevis* have been reported along the coast of northwest Florida over the past few days (MML; 10/23-10/27).

In, recent MODIS Aqua imagery from 10/25 (shown left) patches of elevated to very high chlorophyll (2 to >20 µg/L) are visible along- and offshore northwest Florida from Bay to Taylor counties. Anomalously high chlorophyll continues to be visible, in patches, alongshore and extending up to 55 miles offshore Franklin to Taylor counties. Due to the optical characteristics that are typical in the area, elevated chlorophyll is not necessarily indicative of the presence of *K. brevis*, and some elevated chlorophyll may also be due to various algal species that have been reported throughout the region as well as the resuspension of benthic chlorophyll and sediments along the coast.

Variable winds over the past several days may have minimized the transport of *K. brevis* concentrations. Southeast winds forecasted today through Wednesday may promote northern transport of *K. brevis* concentrations.

Davis, Urízar
Wind Analysis

**Escambia to Taylor counties:** Southeast winds (5-10kn, 3-5m/s) today into Wednesday becoming southwest winds (5kn, 3m/s) Wednesday night. North winds (10kn, 5m/s) Thursday.
Satellite chlorophyll image and forecast winds for October 28, 2014 06Z with points representing cell concentration sampling data from October 17 to 24: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:
http://tidesandcurrents.noaa.gov/hab/habfs_bulletin_guide.pdf

Verified and suspected HAB areas shown in red. Other areas of high chlorophyll concentration shown in yellow (see p. 1 analysis for interpretation).
