**Conditions Report**

*Karenia brevis* (commonly known as Texas red tide) ranges from not present to background concentrations along the coast of Texas. No respiratory irritation is expected alongshore Texas Monday, July 31 through Monday, August 7. For local information check the Texas Parks and Wildlife Department Red Tide page (http://tpwd.texas.gov/landwater/water/environconcerns/hab/redtide/).

**Analysis**

Sampling from Texas A&M University’s Imaging FlowCytobot (IFCB), located on the Port Aransas ship channel, indicates that *Karenia brevis* concentrations range between ‘not present’ and ‘background’ (TAMU; 7/24-31). For information on area shellfish restrictions, contact the Texas Department of State Health Services.

Recent MODIS Aqua ensemble imagery (7/28; shown left) is partially obscured by clouds along the Texas coast, limiting analysis. Elevated to very high chlorophyll (2 to >20µg/L) is visible alongshore from the Sabine Pass region to the Pass Cavallo region with some of the optical characteristics of *K. brevis*. However, elevated chlorophyll in this region is most likely due to the resuspension of benthic chlorophyll and sediments along the coast.

Forecast models based on predicted near-surface currents indicate a potential maximum transport of 10km north from the Port Aransas region from July 28 to August 3.

**Lalime, Kavanaugh**

**Wind Analysis**

**Port Aransas to Matagorda Ship Channel:** East winds (5-15kn, 3-8m/s) today through Tuesday. Southeast to south winds (5-15kn) Tuesday night through Friday night.
Satellite chlorophyll image and forecast winds for August 1, 2017 06Z with points representing cell concentration sampling data from July 21 to 27: red (high), orange (medium), yellow (low b), brown (low a), blue (very low b), purple (very low a), pink (present), and green (not present). Cell count data are provided by Texas Parks and Wildlife Department. For a list of sample providers and a key to the cell concentration categories, please see the HAB-OFS bulletin guide:

Verified and suspected HAB areas shown in red. Other areas with *K. brevis* optical characteristics shown in yellow (see p. 1 analysis for interpretation).
