Conditions Report

There is currently no indication of *Karenia brevis* (commonly known as Texas red tide) along the coast of Texas. No respiratory irritation is expected alongshore Texas Monday, October 2 through Tuesday, October 10. For local information, check the Texas Parks and Wildlife Department Red Tide page (http://tpwd.texas.gov/landwater/water/environconcerns/hab/redtide/).

Analysis

*Due to the upcoming federal holiday, the next bulletin will be issued on Tuesday, October 10.*

Data from Texas A&M University’s Imaging FlowCytobot (IFCB), located on the Port Aransas ship channel, is currently unavailable. For information on area shellfish restrictions, contact the Texas Department of State Health Services.

Where visible, recent MODIS Aqua ensemble imagery (10/1; shown left), continues to indicate elevated to very high chlorophyll (2 to >20 µg/L) alongshore from Sabine Pass to the Rio Grande. However, elevated chlorophyll in this region is most likely due to the resuspension of benthic chlorophyll and sediments along the coast.

Forecast models based on predicted near-surface currents indicate a potential maximum transport of >150 km south from the Port Aransas region from October 1 to October 5.

Keene, Davis

![Wind conditions from Port Aransas-Coast, TX](image)

Wind speed and direction are averaged over 12 hours from buoy measurements. Length of line indicates speed; angle indicates direction. Red indicates that the wind direction favors upwelling near the coast. Values to the left of the dotted vertical line are measured values; values to the right are forecasts. Wind observation and forecast data provided by NOAA’s National Weather Service (NWS).

Wind Analysis

**Port Aransas to Matagorda Ship Channel:** East to southeast winds (5-20kn, 3-10m/s) today through Friday.
