Analysis
The *Microcystis* cyanobacteria bloom continues in the western basin of Lake Erie. In recent satellite imagery (8/18), the bloom extends from Maumee Bay north along the Michigan coast to Brest Bay, and extends along the Ohio coast to 6 miles northeast of the Toussaint River. Low concentrations are also present up to 3 miles east of Pelee Island. Winds observed over the weekend (8/18-19) promoted mixing of surface *Microcystis* concentrations. Toxin concentrations were detected at all sampling sites but are still below the recreational threshold throughout the bloom extent of the bloom. *Keep pets and yourself out of the water in areas where scum is forming.* The persistent cyanobacteria bloom in Sandusky Bay continues.

Forecasts
Winds (6-18 kn) forecast today through Thursday (8/20-23) will likely lead to mixing of surface *Microcystis* concentrations and may promote northwestward transport. --Ludema, Davis
