

Lake Erie Harmful Algal Bloom Bulletin

17 September, 2018, Bulletin 26

Analysis

The *Microcystis* cyanobacteria bloom continues in the western basin of Lake Erie. Recent satellite imagery (9/16) shows the bloom extending from the Maumee Bay east along the coast of Ohio to the Magee Marsh Wildlife Area. A large sediment plume throughout the western basin may be obscuring detected concentrations. Winds observed over the weekend (9/14-16) likely promoted slight mixing of *Microcystis* concentrations. Toxin concentrations were detected at all sampling sites but remain below the recreational threshold. *Keep pets and yourself out of the water in areas where scum is forming.* The persistent cyanobacteria bloom in Sandusky Bay continues.

Forecasts

Winds (3-20 kn) forecast today through Thursday (9/17-20) will promote mixing of surface waters and westward transport of *Microcystis* concentrations. --Lalime, Ludema

Figure 1. Cyanobacterial Index from modified Copernicus Sentinel 3 data collected 16 September, 2018 at 11:49 EST. Grey indicates clouds or missing data. The estimated threshold for cyanobacteria detection is 20,000 cells/mL.

Figure 2. Cyanobacterial Index from modified Copernicus Sentinel 3 data collected 16 September, 2018 at 11:49.

Wind speed and direction from Marblehead, OH. Blooms mix through the water column at wind speeds greater than 15 knots (or 7.7 m/s).
